## SM286 – Quiz 4 – Section 3.1 Newton's Law of Cooling

1. A thermometer is removed from a room where the temperature is  $70^{\circ}\text{F}$  and is taken outside, where the air temperature is  $10^{\circ}\text{F}$ . After half a minute the thermometer reads  $50^{\circ}\text{F}$ . How long will it take for the thermometer to reach  $15^{\circ}\text{F}$

$$T(0) = 70^{\circ}\text{F}$$

$$T_m = 10^{\circ}\text{F}$$

$$T(30) = 50^{\circ}\text{F}$$

$\uparrow$   
sec

$$\frac{dT}{dt} = k(T - T_m)$$

$$\Rightarrow \left( \frac{dT}{T - 10} \right) = k dt \Rightarrow \ln(T - 10) = kt + C$$

$$\Rightarrow T - 10 = e^{kt+C} = ae^{kt}$$

$$\Rightarrow T = ae^{kt} + 10 \Rightarrow T(0) = a + 10 = 70 \Rightarrow a = 60$$

$$\Rightarrow T = 60e^{kt} + 10 \Rightarrow T(30) = 60e^{30k} + 10 = 50$$

$$\Rightarrow e^{30k} = \frac{40}{60} = \frac{2}{3} \Rightarrow k = \frac{1}{30} \ln\left(\frac{2}{3}\right) \approx -0.0135$$

$$\Rightarrow T = 60e^{-0.0135t} + 10$$

$$T(?) = 60e^{-0.0135t} + 10 = 15$$

$$\Rightarrow e^{-0.0135t} = \frac{5}{60} = \frac{1}{12} \Rightarrow \boxed{184.1 \text{ sec}}$$
